1. Introduction

1.1. Notice

- (1) This manual is dedicated for developers who develop the applications base on the xArm Modbus-TCP communication protocol. For xArm Studio application development, please refer to "xArm User Manual". For Python (C++ or ROS) application development, please refer to "1.6 Further Developer Resources".
- (2) Considering the potential risks of using xArm Modbus-TCP communication protocol for application development, operators need to read and understand all the contents of "xArm User Manual", familiar with xArm risk assessment and robot motion planning, and proficient in robot parameter setting and program creating in "xArm Studio" before Modbus-TCP end developing.

Before meeting the above conditions, we strongly recommend operators should refer to 'xArm User Manual' and program xArm robot by xArm Studio. Until then, operators could start xArm Modbus-TCP application development based on the communication protocol xArm provided.

It will reduce the potential risks as well as increase the efficiency of your application development based on xArm Modbus-TCP.

1.2. Main Contents of the Manual

- (1) xArm motion characteristics
- (2) <u>xArm Communication Protocol</u>
- (3) xArm error reporting and handling
- (4) xArm technical specifications

1.3. xArm Motion Parameters

The parameters of the robotic arm are shown in Table 1.1 and Table 1.2.

Table 1.1 working range of each joint of the robotic arm

| | Robotic Arm | xArm 5 | xArm 6 | xArm 7 |
|---------------|----------------|---------------|-------------|-------------|
| Maximum Speed | | 180°/s 180°/s | | 180°/s |
| | 1st Axis | ±360° | ±360° | ±360° |
| | 2st Axis | −118° ~120° | −118° ~120° | −118° ~120° |
| | 3st Axis | −225° ~11° | −225° ~11° | ±360° |
| Working Range | 4st Axis | −97° ~180° | ±360° | −11° ~225° |
| | 5st Axis ±360° | | −97° ~180° | ±360° |
| | 6st Axis | None | ±360° | −97° ~180° |
| | 7st Axis | None | None | ±360° |

Table 1.2 range of various motion parameters of the robotic arm

| | TCP Motion | Joint Motion |
|--------------|------------------------|--------------|
| Speed | 0∼1000mm/s | 0∼180° /s |
| Acceleration | $0\sim$ 50000mm/s 2 | 0~1145° /s² |
| Jerk | $0\sim$ 10000mm/s 3 | 0∼28647° /s³ |

Note:

- 1. In the TCP motion (Cartesian space motion) commands (set_position () function of the SDK), If a motion command involves both position transformation and attitude transformation, the attitude rotation speed is generally calculated automatically by the system. In this situation, the specified speed parameter is the maximum linear speed, range from: 0 \sim 1000mm / s.
- 2. When the expected TCP motion only changes the attitude (roll, pitch, yaw), with position (x, y, z) remains unchanged, the specified speed is the attitude rotation speed, so the range 0 to 1000 corresponds to 0 to 180 $^{\circ}$ / s.

1.4. Unit Definition

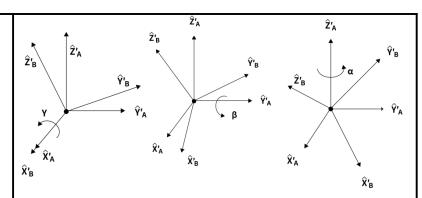

The Python / Blockly examples and the units standard in the communication protocol are shown in Table 1.3.

Table 1.3. Default units in Python / Blockly example and Communication Protocol

| Parameter | Python-SDK | Blockly | Communication |
|---------------------------------|-----------------|-----------------|-----------------|
| X (Y/Z) | millimeter (mm) | millimeter (mm) | millimeter (mm) |
| Roll (Pitch/Yaw) | degree (°) | degree (°) | radian (rad) |
| $J_1 (J_2/J_3/J_4/J_5/J_6/J_7)$ | degree (°) | degree (°) | radian (rad) |
| TCP Speed | mm/s | mm/s | mm/s |
| TCP Acceleration | mm/s^2 | mm/s^2 | mm/s^2 |
| TCP Jerk | mm/s^3 | mm/s^3 | mm/s³ |
| Joint Speed | °/s | °/s | rad/s |
| Joint Acceleration | °/s² | °/s² | rad/s² |
| Joint Jerk | °/s³ | °/s³ | rad/s³ |

1.5. Terms and Definitions

| Control Box | The control box, core part of the robotic arm, is the integration of the robotic arm control system. |
|---|--|
| End Effector | The end effector, installed on the front end of the wrist of the robotic arm, is used to install special tools (such as grippers, vacuum gripper, etc.), which can directly perform work tasks. |
| Enable Robotic Arm | Power on the robotic arm and turn on the motor of the robotic arm. After the robotic arm is enabled, it can start to move normally. |
| TCP | Tool center point. |
| TCP Motion | TCP motion is the Cartesian space motion, with target position in Cartesian space coordinate and the end follows the specified trajectory(arc, line, etc.). |
| TCP Payload (End Payload) | The payload weight refers to the actual (end tool +other object) weight in Kg; the X / Y / Z-axis indicates the position of the center of mass of the TCP relative to the default tool coordinate system, with unit of mm. |
| TCP Offset (Tool Center Point Offset) | Set the relative offset between the default tool coordinate system at flange center and the actual tool coordinate system, with distance unit of mm. |

Roll / Pitch / Yaw sequentially rotates around the X / Y / Z of the selected coordinate system (base coordinate system).

The following describes the roll/pitch/yaw orientation representation of $\{B\}$ relative to $\{A\}$:

Roll/Pitch/Yaw

For example, the coordinate system $\{B\}$ and a known reference coordinate system $\{A\}$ are first superposed. First rotate $\{B\}$ around \hat{X}_A by γ , then around \hat{Y}_A by β , and finally around \hat{Z}_A by α .

Each rotation is around a fixed axis of the reference coordinate system $\{A\}$. This method is called the XYZ fixed angle coordinate system, and sometimes they are defined as the roll angle, pitch angle, and yaw angle.

The above description is shown in the following figure:

The equivalent rotation matrix is:

$${}_{B}^{A}R_{XYZ}(\gamma,\beta,\alpha) = R_{Z}(\alpha)R_{Y}(\beta)R_{X}(\gamma)$$

Note: γ corresponds to roll; β corresponds to pitch; α corresponds to yaw.

| | Rx / Ry / Rz representation also, using 3 values to represent the pose (but not three rotation angles), which is the product of a |
|------------------------|---|
| | |
| | three-dimensional rotation vector [x, y, z] and a rotation angle[phi |
| | (scalar)]. |
| | The characteristics of the axis angle: |
| | Assume the rotation axis is $[x, y, z]$, and the rotation angle is |
| | phi. |
| | Then the representation of the axial angle: |
| Axis-Angle | [Rx, Ry, Rz] = [x * phi, y * phi, z * phi] |
| | Note: |
| | 1. [x, y, z] is a unit vector, and phi is a non-negative value. |
| | 2. The vector length (modulus) of [Rx, Ry, Rz] can be used to estimate |
| | the rotation angle, and the vector direction is the rotation |
| | direction. |
| | 3. If you want to express reverse rotation, invert the rotation axis |
| | vector [x, y, z], and the value of phi remains unchanged. |
| | 4. Using phi and [x, y, z] can also derive the attitude representation |
| | as unit quaternion q = [cos (phi / 2), sin (phi / 2) * x, sin (phi |
| | / 2) * y, sin (phi / 2) * z]. |
| | For example: |
| | The vector of the rotation axis represented by the base coordinate |
| | system is [1, 0, 0], and the rotation angle is 180 degrees (π), then |
| | the axis angle representation of this pose is $[\pi, 0, 0]$. |
| | The rotation axis is [0.707, 0.707, 0] and the rotation angle is 90 |
| | degrees (π / 2), then the axis angle posture is [0.707 * (π / 2), |
| | 0.707 * (π / 2), 0]. |
| The Base Coordinate | The base coordinate system is a Cartesian coordinate system based |
| System | on the mounting base of the robotic arm and used to describe the motion |
| (please refer to the | of the robotic arm. |
| figure 1) | (front and back: X axis, left and right: Y axis, up and down: Z axis) |
| Tool Coordinate System | Consists of tool center point and coordinate orientation. If the TCP |
| (please refer to the | offset is not set, the default tool coordinate system is located at |
| figure 1) | flange center. |
| | For tool coordinate system based motion: The tool center point is |
| | taken as the zero point, and the trajectory of the robotic arm refers |
| | to the tool coordinate system. |
| User Coordinate System | The user coordinate system can be defined as any other reference |

| (please refer to the figure 1) | coordinate system rather than the robot base. |
|--------------------------------|--|
| Manual Mode | In this mode, the robotic arm will enter the 'zero gravity' mode, since the gravity is compensated, the user can guide the robotic arm position directly by hand. |
| Teach Sensitivity | Teach sensitivity range is from 1 to 5 level. The larger the set value, the higher the teach sensitivity level, and the less the force required to drag the joint in the manual mode. |
| Collision Sensitivity | The collision sensitivity range is from 0 to 5 level. When it is set to 0, it means that collision detection is not enabled. The larger the set value, the higher the collision sensitivity level, and the smaller the force required to trigger the collision protection response of the robotic arm. |
| GPIO | General-purpose input and output. For the input, you can check the potential of the pin by reading a register; For the output, you can write a certain register to make this pin output high or low potential; |
| Safety Boundary | When this mode is activated, the boundary range of the cartesian space of the robotic arm can be limited. If the tool center point (TCP) exceeds the set safety boundary, the robotic arm will stop moving. |
| Reduced Mode | When this mode is activated, the maximum linear velocity of the Cartesian motion of the robotic arm, the maximum joint speed, and the range of the joint motion will be limited. |

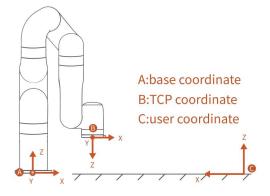

Figure 1

1.6. Further Developer Resources

ROS Library & Github: https://github.com/xArm-Developer/xarm_ros

xArm Python SDK Library:

https://github.com/xArm-Developer/xArm-Python-SDK

xArm CPLUS SDK Library:

https://github.com/xArm-Developer/xArm-CPLUS-SDK

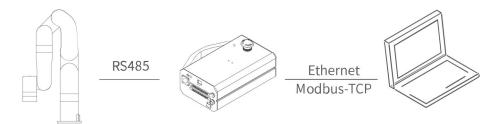

Note: For the above three developer resources, we have detailed installation steps and commands on github. Please download the installation package for further development.

1.7. More Information

- More product information: https://www.ufactory.cc/#/en/
- For technical support, please email to: support@ufactory.cc
- For sales support, please email to: sales@ufactory.cc

2. xArm Communication Protocol

2.1. Control Box Communication Protocol

Note: The current protocol has some format changes for xArm. Please use this manual as the main protocol when running the robotic arm.

The main content of this chapter has two parts:

- (1) Control the motion of the robotic arm by Modbus TCP through AC/DC Control Box.
- (2) Control the IO device of the control box and the IO device at the end of the robotic arm by Modbus TCP through AC/DC Control Box.

2.1.1. Unit Definition

The following explains some of the symbols used in the examples and tables:

【u8】: 1 Byte, 8-bit unsigned int

【u16】: 2 Bytes, 16-bit unsigned int

[fp32]: 4 Bytes, float

[str]: String

[System reset]: The user just enters the state after the mode switch or changes some settings (such as TCP offset, sensitivity, etc.). The above operations will terminate the ongoing movement of the robotic arm and clear the cache commands, which is the same as the STOP state.

2.1.2. Modbus-TCP Communication Format

Modbus-TCP:

Modbus protocol is an application layer message transmission protocol, including three message types: ASCII, RTU, and TCP. The standard Modbus protocol physical layer interface includes RS232, RS422, RS485 and Ethernet interfaces, and adopts master / slave communication.

Modbus TCP Communication Process:

- 1. Establish a TCP connection.
- 2. Prepare Modbus messages.
- 3. Use the send command to send a message.
- 4. Waiting for a response under the same connection.
- 5. Use the recv command to read the message and complete a data exchange.
- 6. When the communication task ends, close the TCP connection.

Parameter:

Default TCP Port: 502

Protocol: 0x00 0x02 Control (Only this one for now)

Request Commands Format

| Format | Transaction | Protocol | Length | Register | Parameters |
|--------------------------|-------------|-----------|-----------|----------|-------------------|
| | Identifier | (u16) | (u16) | (u8) | (Refer to the |
| | (u16) | | | | statement of each |
| | | | | | commands |
| Length | 2 Bytes | 2 Bytes | 2 Bytes | 1 Byte | n Bytes |
| | | | | | |
| Example | 0x00 0x01 | 0x00 0x02 | 0x00 0x03 | 0x0B | 0x08 0x01 |
| (Enable the robotic arm) | | | | | |

Response command format

| Format | Transaction | Protocol | Length | Register | Status | Parameters |
|--------------------------|-------------|-----------|-----------|----------|--------|-------------------|
| | Identifier | (u16) | (u16) | (u8) | (u8) | (Refer to the |
| | (u16) | | | | | statement of each |
| | | | | | | commands) |
| Length | 2 Bytes | 2 Bytes | 2 Bytes | 1 Byte | 1 Byte | n Bytes |
| Example | 0x00 0x01 | 0x00 0x02 | 0x00 0x02 | 0x0B | 0x00 | none |
| (Enable the robotic arm) | | | | | | |

Status Bit of the Response Format

| Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
|-----------|--------------------|----------------------|------------------------------------|------|-----------|-----------|-----------|
| 0: normal | 1: error 0: normal | 1: warning 0: normal | 1: cannot perform motion 0: normal | | 0: normal | 0: normal | 0: normal |

General notes:

- ●Transaction Identifier: Generally, 1 is added after each communication to distinguish different communication data packets.
- Protocol : 0x00 0x02 means ModbusTCP protocol.
- Length: Indicates the next data length in bytes.
- Register: Device address.
- On the problem of users using communication protocols to organize data in big endian and little endian:

Modbus-TCP control protocol:

- 1. The transaction identifier (u16) are analyzed in big endian order.
- 2. protocol identifier (u16) and are analyzed in big endian order.
- 3. length (u16) of the message head are analyzed in big endian order.
- 4. The 32-bit data (fp32, int32) in the parameter are analyzed in little endian order.
- 5. Integer data(u16) involving GPIO operation are analyzed in big endian order.

Automatic reporting data analysis:

- 1. Integer data (16/32 bits) are analyzed in big endian order.
- 2. Floating-point (fp32) data is analyzed in little endian order.

Example:

Assume that the type of the variable x is int, located at address 0x100, there is a hexadecimal number 0x12345678 (high order is 0x12, low order is 0x78), and the byte order of the address range 0x100-0x103 depends on the type of machine:

Big-endian method:

| | 0x100 | 0x101 | 0x102 | 0x103 | |
|-----|-------|-------|-------|-------|--|
| ••• | 0x12 | 0x34 | 0x56 | 0x78 | |

Little-endian method:

| 0x100 | 0x101 | 0x102 | 0x103 | |
|----------|-------|-------|-------|--|
| 0x78 | 0x56 | 0x34 | 0x12 | |

2.1.3. Register (Robotic Arm Control)

2.1.3.1 Register (General)

The following is an example of joint motion, axis angular motion, setting parameters, getting parameters, and special IO commands

| | Joint | Set the | Get | Linear motion of | The operation triggered |
|----------|--------|------------|-----------|-------------------|---------------------------|
| Function | motion | maximum | cartesian | the target in the | by the position of the |
| | | accelerati | position | axial angle | general digital IO of the |
| | | on of TCP | | posture | control box |
| | | motion | | | |

| Joint motion (P2P motion) | | | | | | |
|---------------------------|-----------------------------------|---------|------|------------------------|--|--|

2.1.3.2 Register (Robotic Arm Control)

```
0~10: Public Port Section
Get version information (0x01)
Get Serial Number information (0x02)
Reload friction parameters (0x04)
Get the value of joint torque or actual current (0x05)
Get the radius of rotation of the target joint relative to the TCP (0x06)
Remotely shut down the operating system (0x0A)
11~20: System State
Enable/Disable servo (System reset) (0x0B)
Motion state setting (0x0C)
Get the motion state (0x0D)
Get the number of commands in the command buffer (0x0E)
Get error and warning code (0x0F)
Clear control box error (System reset) (0x10)
Clear control box warning (0x11)
Setting the brake switches separately (0x12)
Setting the system motion mode (0x13)
20~30: Basic Motion
Cartesian linear motion (0x15)
Linear motion with circular arc (0x16)
P2P joint motion (0x17)
Joint motion with circular arc (0x18)
Return to zero position (0x19)
Pause commands, Commands delay (0x1A)
Linear circular motion (0x1B)
```

```
Linear motion in tool coordinate system (0x1C)
Servoj motion (0x1D)
Servo cartesian motion (0x1E)
31~40: System Parameter Setting
Set the jerk of the cartesian space translation (0x1F)
Set the maximum acceleration of the cartesian space translation (0x20)
Set joint space jerk (0x21)
Set joint space max acceleration (0x22)
Set the offset of the robotic arm end-effector(System reset) (0x23)
End payload setting (0x24)
Set collision detection sensitivity (System reset) (0x25)
Set teaching sensitivity for teaching mode (System reset) (0x26)
Delete the current system configuration parameters (0x27)
Save the current system configuration parameters (0x28)
41~50: Get Motion Information
Get the current cartesian position of the robotic arm (0x29)
Get the current joint position of the robotic arm (0x2A)
Get the solution of the inverse kinematics (0x2B)
Get the solution of the forward kinematics (0x2C)
Check the limit of the joint space (0x2D)
Set TCP speed limit in Reduced Mode (0x2F)
Set Toint speed limit in Reduced Mode (0x30)
Get the state of the Reduced Mode (0x31)
Set the state of the Reduced Mode (0x32)
51~100: Other Robotic Arm Functions
Set the gravity direction (0x33)
Set the safe boundary range (0x34)
Get all configurations of the Reduced Mode (0x35)
Get current joint torque of the servo (0x37)
Set joint range limit of Reduced Mode (0x3A)
```

```
Safety boundary start switch (0x3B)
Set the state of Collision Rebound (0x3C)
Start/Stop trajectory record (0x3D)
Save recorded trajectory (0x3E)
Load recorded trajectory (0x3F)
Playback recorded trajectory (0x40)
Get the state of recorded trajectory (0x41)
Set allow to avoid overspeed near some singularities using approximate
solutions (0x42)
Set the joint torque (theoretical) and current of servo (0x46)
Set the offset of the user coordinate system and the base coordinate system
(0x49)
Calculate the attitude offset of two given points (0x4C)
Set the self-collision detection function of the robotic arm (0x4D)
The geometric model of the end tool added when setting the self-collision
detection (0x4E)
Set whether to enable the virtual robotic arm mode (0x4F)
Global setting for Cartesian motion velocity continuous (0x50)
Joint velocity control (0x51)
Cartesian velocity control (0x52)
Relative motion control (0x53)
Get the attitude represented by the axis angle attitude (0x5B)
Linear motion with axis angle attitude as target (0x5C)
Servo_cartesian motion (axis angle) (0x5D)
101~115: Servo Module
Get the state of the current robotic arm servo (0x6A)
```

51~100 Other Robotic Arm Function

Set the gravity direction

Set the gravity direction for correct torque compensation and collision detection. After modification, it shall call the save_conf () function or refer to Register: 40(0x28) to save the setting, otherwise it will be invalid after the next restart.

Linear motion with axis angle attitude as target
When planning a linear motion, the target pose is expressed in terms of axial angles, which
supports the absolute target pose/relative target pose, as well as the motion options of the
base coordinate system/tool coordinate system.

2.1.4. Register (Peripherals Control through Robot IOs)

124: Gripper Module Enable/Disable the gripper (0x7C) Set the gripper mode (0x7C) Set the gripper speed (0x7C)Set the gripper position (0x7C)Get the gripper position (0x7C)Get the gripper error (0x7C)Clear the gripper error (0x7C)124~127: RS485 Control on the End-effector Set the end RS485 baud rate (0x7F) 127~128: IO Control on the End-effector IO control on the End-effector (0x7F) Get the input of the end digital quantity (0x80)Get the input of the end analog (0x80)130~141: IO Control on the Control Box Get configurable digital gpio input (0x83) Get analog input AI1 (0x84) Get analog input AI2 (0x85)

```
Set configurable digital gpio output (0x86)

Set the analog output A01 (0x87)

Set the analog output A02 (0x88)

Configuring digital input IO Function (0x89)

Configuring digital output IO Function (0x8A)

Get GPIO state (0x8B)

142~146: Special IO Commands

Operation of general digital IO delay output of control box (0x8E)

Operation of the end general digital IO delay output (0x8F)

Operation triggered by the position of the general digital IO of the control
```

Operation triggered by the position of the end general digital IO (0x91)

Whether the control box and terminal IO are automatically cleared in the STOP state (0x92)

Operation triggered by the position of the general Analog IO of the control box (0x93)

200~212: 6 Axis Force Torque Sensor

box (0x90)

Get external force detection data of 6 Axis Force Torque Sensor (0xC8)

Enable/Disable 6 Axis Force Torque Sensor (0xC9)

Set the control mode of 6 Axis Force Torque Sensor (0xCA)

Get the control mode of 6 Axis Force Torque Sensor (0xCB)

Perform end payload identification (0xCC)

Set the payload and offset of 6 Axis Force Torque Sensor (0xCD)

Set the current state as the zero point of 6 Axis Force Torque Sensor (0xCE)

Set all impedance control parameters of 6 Axis Force Torque Sensor (0xCF)

Set PID parameter of 6 Axis Force Torque Sensor (0xD0)

Set force control parameter of 6 Axis Force Torque Sensor (0xD1)

Set MKB parameter under impedance control mode of 6 Axis Force Torque Sensor (0xD2)

Set impedance control parameter of 6 Axis Force Torque Sensor (0xD3)

Get all feedback data of 6 Axis Force Torque Sensor (0xD4)

124 Gripper Module

xArm Gripper fixed parameter explanation:

| Parameter | Host ID | Gripper ID | Function Code |
|-------------|---------|------------|---------------|
| Length | 1Byte | 1Byte | 1Byte |
| Fixed Value | 0x09 | 0x08 | 0x10 |

Note:

- 1. If it is a third-party gripper, the gripper ID and function code are different from the fixed values above.
- 2. Gripper control is based on $\ensuremath{\mathsf{RS485}}$ port on the end-effector.

2.1.5. Modbus TCP Example

If you want the robotic arm to perform a basic motion, please send the commands as follows:

(1) Enable the robotic arm.

- (2) Set the motion mode of the robotic arm.
- (3) Set the motion state of the robotic arm.
- (4) Send motion commands.

The following will give an example according to the above steps:

| Function Enable | e the robotic arm | Setting mode | Setting state | Cartesian linear motion |
|-----------------|-------------------|--------------|---------------|-------------------------|
|-----------------|-------------------|--------------|---------------|-------------------------|

Note:

- (1) 3.2.4 has a detailed description of the register list.
- (2) Please refer to P31-P32 for the format of the request and response command parameters in the following examples.
- (3) The following explains some of the symbols used in the examples and tables:

u8 (1 Byte, 8-bit unsigned int)
u16 (2 Bytes, 16-bit unsigned int, big-endian analysis)
fp32 (4 Bytes, float, little-endian analysis)
str (string)

| Enable the robotic arm | | | | | | |

3. Error Reporting and Handling

3.1. Joints Error Message and Error Handling

- Error processing method: Re-power on, the steps are as follows:
 - 1. Turn the emergency stop button on the control box
 - 2. Enable robotic arm
- xArm Studio enable mode: Click the guide button in the error pop-up window or the [Enable Robot] button on the homepage.
- xArm-Python-SDK enable mode: <u>Error Handling Mode.</u>
- xArm-library: operators can view related documents at https://github.com/xArm-Developer/xarm_ros
- If the problem remains unsolved after power on/off for multiple times, please contact UFACTORY team for support.

| Software Error Code | Error Code | Error Handling |
|---------------------|------------|---|
| | | Joint Communication Error |
| S0 | 0x00 | Please restart the xArm with the Emergency Stop Button on |
| 30 | 0.00 | the Control Box. If multiple reboots do not work, please |

| | | Initialization of Motor Angle Error |
| S52 | 0x34 | Please restart the xArm with the Emergency Stop Button on |
| | | the xArm Control Box. |

3.2. Control Box Error Code and Error Handling

3.2.1. Control Box Error Code

If there is any error in the hardware of the robotic arm in the software of the Control Box/in sending command, an error or warning will be issued. This error/warning signal will be fed back when the operators send any command; In other words, the feedback is passive and not actively reported.

After the above error occurs, the robotic arm will stop working immediately and discard the Control Box cache command. Users need to clear these errors manually to allow normal operation. Please re-adjust the motion planning of the robotic arm according to the reported error message.

| Software Error Code | Error Code | Error Handling |
|---------------------|------------|--|
| C1 | 0x01 | The Emergency Stop Button on the Control Box is Pushed in to Stop Please release the Emergency Stop Button, and then click "Enable Robot" |
| C2 | 0x02 | The Emergency IO of the Control Box is triggered Please ground the 2 EIs of the Control Box, and then click "Enable Robot". |
| C3 | 0x03 | The Emergency Stop Button of the Three-state Switch is pressed Please release the Emergency Stop Button of the Three-state Switch, and then click "Enable Robot". |
| C11-C17 | 0x0B-0x11 | Power on again. |
| C19 | 0x13 | End Module Communication Error Please check whether gripper is installed and the baud rate setting is correct. |
| C21 | 0x15 | Kinematic Error Please re-plan the path. |
| C22 | 0x16 | Self-collision Error, Please Re-plan the Path. If the robotic arm continues to report self-collision errors, please go to the "live control" interface to turn on the "manual mode" and drag the robotic arm back to the normal position. |
| C23 | 0x17 | Joints Angle Exceed Limit Please click the "ZERO" button to return to the zero pozition. |
| C24 | 0x18 | Speed Exceeds Limit Please check if the xArm is at singularity point, or reduce the speed and acceleration values. |

| | <u> </u> | |
|-----|----------|---|
| C25 | 0x19 | Planning Error |
| | | Please re-plan the path or reduce the speed. |
| C26 | 0x1A | Linux RT Error |
| | | Please contact technical support. |
| | | Command Reply Error |
| C27 | 0x1B | Pleas retry, or restart the xArm with the Emergency Stop |
| | | Button on the xArm Control Box. |
| C29 | 0x1D | Other Errors |
| 629 | OXID | Please contact technical support. |
| C20 | 015 | Feedback Speed Exceeds limit |
| C30 | 0x1E | Please contact technical support. |
| | | Collision Caused Abnormal Current |
| G01 | 0.15 | Please check for collisions, check that the payload |
| C31 | 0x1F | settings are correct, and that the collision sensitivity |
| | | matches the speed. |
| 200 | | Three-point drawing circle calculation error |
| C32 | 0x20 | Please reset the arc command. |
| | | Abnormal current in the robotic arm |
| | | 1. Check whether the robotic arm collides. |
| | | 2. Check whether the mass and center of mass set at |
| | | "Settings"-"TCP Settings"-"TCP Payload" match the |
| | | actual payload. |
| | | 3. Check whether the mounting direction set at |
| C33 | 0x21 | "Settings"-"Mounting" matches the actual situation. |
| | | 4. Check whether the TCP payload parameters set in your |
| | | program match the actual payload. |
| | | 5. Reduce the motion speed of the robotic arm. |
| | | 6. Go to "Settings"-"Motion"-"Sensitivity Settings" to |
| | | lower the collision sensitivity. |
| | | Recording Timeout |
| C34 | 0x22 | The track recording duration exceeds the maximum duration |
| | | limit of 5 minutes. It is recommended to re-record. |
| | | Safety Boundary Limit |
| C35 | 0x23 | The xArm reaches the safety boundary. Please let the xArm |
| | | work within the safety boundary. |
| | | The number of delay commands exceeds the limit |
| C36 | 0x24 | 1. Please check whether there are too many position |
| | | 1. Trease check whether there are too many position |

| | | detection or IO delay commands. |
|------|------|--|
| | | 2. Increase the tolerance of the position detection |
| | | command. |
| | | Abnormal Motion in Manual Mode |
| C37 | 0x25 | Please check whether the TCP payload setting of the |
| | 0.25 | robotic arm and the installation method of the robotic |
| | | arm match the actual settings. |
| | | Abnormal Joint Angle |
| C38 | 0x26 | Please stop the xArm by pressing the Emergency Stop Button |
| | | on the Control Box. |
| C39 | 0x27 | Abnormal Communication Between Master and Slave IC of |
| C39 | UX21 | Power Board. |
| | | Six-axis Force Torque Sensor Error |
| C50 | 0x32 | Please check the sensor error code, locate the problem, |
| C50 | UX32 | and power on again. If it cannot be resolved, please |
| | | contact technical support. |
| C51 | 0x33 | Six-axis Force Torque Sensor Mode Setting Error |
| | | Please make sure that the robotic arm is not in Manual |
| | | Mode, check whether the given value of this command is |
| | | 0/1/2 |
| | | Six-axis Force Torque Sensor Zero Setting Error |
| C52 | 0x34 | Please check the sensor communication wiring and whether |
| | | the power is normal. |
| C53 | 0x35 | Six-axis Force Torque Sensor Overload |
| | OXOU | Please reduce the payload or applied external force. |
| C110 | 0x6E | Robot Arm Base Board Communication Error |
| 0110 | | Please contact technical support. |
| C111 | 065 | Control Box External 485 Device Communication Error. |
| C111 | 0x6F | Please contact technical support. |
| | | |

For alarm codes that are not listed in the above table: Power on again. If the problem remains unsolved after power on/off for multiple times, please contact technical support.

3.2.2. Control Box Error Code

The error does not affect the normal operation of the robotic arm, but it may affect the operators' program operations. Once the warning occurs,

the arm will set the warning flag and return it together in the command reply. Despite that, no other operations will be performed. The robotic arm will still operate normally.

| Error code | Description | Error Handling |
|------------|----------------------------|-------------------------------------|
| 11 (0x0B) | Buffer overflow | Control the volume of command cache |
| 12 (0x0C) | Command parameter abnormal | Check sent command |
| 13 (0x0D) | Unknown Command | Check sent command |
| 14 (0x0E) | Command no solution | Check sent command |

3.3. Gripper Error Code & Error Handling

Operators can power off and on the system as an error handling, the steps are as follows (re-powering needs to go through all the following steps):

- 1. Re-powering the robotic arm via the emergency stop button on the control box.
 - 2. Enable robotic arm.
 - a. xArm Studio enable mode:Click the guide button in the error pop-up window or the [Enable Robot] button on the homepage.
 - b. xArm-Python-SDK enable mode: <u>xArm-Python-SDK Error Handling</u>.
 - c. xArm_ros library: users can view related documents at https://github.com/xArm-Developer/xarm ros
 - 3. Re-enable the gripper.

If the problem remains unsolved after power on/off for multiple times, please contact UFACTORY team for support.

| Software Error Code | Error Code | Error Handling |
|---------------------|------------|--|
| | | Gripper Current Detection Error |
| G9 | 0x09 | Please restart the xArm with the Emergency Stop Button |
| | | on the xArm Control Box. |
| G11 | 0x0B | Gripper Current Overlimit |
| GII | UXUD | Please click "OK" to re-enable the Gripper. |

| | | Gripper Speed Overlimit |
|-----|------|---|
| G12 | 0x0C | Please click "OK" to re-enable the Gripper. |
| | | |
| G14 | 0x0E | Gripper Position Command Overlimit |
| | | Please click "OK" to re-enable the Gripper. |
| 015 | 0.00 | Gripper EEPROM Read and Write Error |
| G15 | 0x0F | Please click "OK" to re-enable the Gripper. |
| 200 | 0.14 | Gripper Driver IC Hardware Error |
| G20 | 0x14 | Please click "OK" to re-enable the Gripper. |
| 204 | | Gripper Driver IC Initialization Error |
| G21 | 0x15 | Please click "OK" to re-enable the Gripper. |
| | | Gripper Large Motor Position Deviation |
| G23 | 0x17 | Please check if the movement of the Gripper is blocked, |
| | | if not, please click "OK" to re-enable the Gripper. |
| | | Gripper Command Over Software Limit |
| G25 | 0x19 | Please check if the gripper command is set beyond the |
| | | software limit. |
| | | Gripper Feedback Position Software Limit |
| G26 | 0x1A | Please contact technical support. |
| 000 | 0.01 | Gripper Drive Overloaded |
| G33 | 0x21 | Please contact technical support. |
| C24 | 000 | Gripper Motor Overload |
| G34 | 0x22 | Please contact technical support. |
| 000 | 0.04 | Gripper Driver Type Error |
| G36 | 0x24 | Please click "OK" to re-enable the Gripper. |

xArm-Python-SDK Error Handling:

When designing the robotic arm motion path with the Python library, if the robotic arm error (see Appendix for Alarm information) occurs, it needs to be cleared manually. After clearing the error, the robotic arm should be motion enabled.

Python library error clearing steps: (Please check GitHub for details on the following interfaces)

- a. Error clearing: clean_error()
- b. Re-enable the robotic arm: motion_enable(true)
- c. Set the motion state: set_state(0)
